

Column Recovery With Running Footers

GAMMA-START Fixed-layout documents frequently carry running footers and centred page numbers that sit directly beneath the column gutter.

Method

A naive channel search treats any glyph overlapping the gutter x-range as blocking, regardless of its vertical position on the page.

The consequence is that a single centred page number defeats column detection for the entire page. GAMMA-END

DELTA-START Evaluation therefore must include pages bearing footers, not only clean bodies.

Results

Symmetric peeling from both the top and the bottom restores correct column recovery on such pages. DELTA-END
